Abstract

The prosthesis comprises a number of modular elements (1), (2) and (3) which are designed in combination in order to ensure a support and fixation in the metaphysis without contact at the level of the diaphysis. This prosthesis comprises in particular a metaphyseal support element (1) which is intended to receive a femoral head. The said element (1), which is designed to be fixed in the corresponding part of the medullary cavity, is equipped at the end with a diaphyseal shaft (2) which is engaged freely in the said cavity and whose free end receives a centring element (3) which is able to be positioned bearing in the foot of the medullary cavity.
